DIRECT TESTIMONY

OF

DERAL DANIS

ON BEHALF OF

SOUTHERN SPIRIT TRANSMISSION LLC

FEBRUARY 2023

DIRECT TESTIMONY OF DERAL DANIS

I. INTRODUCTION AND EXPERIENCE

Q1. PLEASE STATE YOUR NAME, BUSINESS ADDRESS, EMPLOYER AND JOB TITLE.

A. My name is Deral Danis. My business address is 1201 Louisiana Street, Suite 3200, Houston, Texas 77002. I work for Pattern Energy Group (“Pattern”) as Senior Director of Transmission.

Q2. ON WHOSE BEHALF ARE YOU TESTIFYING?

A. I’m testifying on behalf of Southern Spirit Transmission LLC (“SST”) and in support of the SST’s Petition for a Certificate of Public Convenience and Necessity (the “Petition”) for the Mississippi facilities which SST proposes to construct as part of the Southern Spirit Transmission Project (the “Project”).

Q3. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.

A. I have Associate of Science and Bachelor of Science degrees in Electrical and Computer Engineering Technology from Purdue University and a Master of Science in Electrical and Computer Engineering from Kansas State University.

I have been working in the electrical power industry for over 17 years. I started my career as an operations engineer in Southwest Power Pool, Inc.’s (“SPP”) operations control center as a NERC-certified Reliability Coordinator providing analytical support to SPP’s control room operations personnel. I then moved into a role tasked with simulating the

1 grid in the Southeastern U.S., including the Mississippi electric system, at Constellation
2 Energy which provided wholesale load supply and portfolio management services to
3 various municipal utilities and power cooperatives in the Southeast. In this role I helped
4 optimize the ability to procure power and deliver it reliably to these utilities as well as
5 participated in various stakeholder endeavors nationally and locally such as with the
6 Midcontinent Independent System Operator, Inc. ("MISO") and the Southeastern Regional
7 Transmission Planning group. Thereafter, I joined the team at Clean Line Energy Partners
8 LLC ("Clean Line") as a Transmission Engineer where I focused on the grid integration,
9 interconnection, and operations plans for Clean Line's portfolio of High Voltage Direct
10 Current ("HVDC") transmission lines across the U.S. Following my time at Clean Line, I
11 joined ConnectGen, LLC where I supported the development of renewable energy projects
12 (i.e., wind, solar and energy storage) across the U.S., including interconnection and
13 integration support, equipment procurement, contracting with Engineering, Procurement,
14 and Construction ("EPC") contractors, and engineering design reviews, among other
15 activities. More recently in my role as Senior Director of Transmission at Pattern, I have
16 been leading a team of professionals tasked with analyzing the U.S. power grid to identify
17 opportunities to develop new renewable energy projects and transmission assets that
18 provide the best value for load serving entities while maintaining or enhancing grid
19 reliability and resiliency. In this role I also focus on the interconnection and integration
20 work on Pattern's transmission projects including the SunZia Transmission Project – a
21 3,000 MW, ± 525 -kV HVDC transmission link between New Mexico and Arizona – as well
22 as the Southern Spirit Transmission Project. My resume is attached hereto as Exhibit DD -
23 1.

1 **Q4. HAVE YOU TESTIFIED PREVIOUSLY BEFORE THE MISSISSIPPI PUBLIC**
2 **SERVICE COMMISSION?**

3 A. No.
4

5 **Q5. HAVE YOU REVIEWED THE PRIOR FILED TESTIMONY IN THIS DOCKET**
6 **FROM DAVID PARQUET?**

7 A. Yes, I have.
8

9 **Q6. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

10 A. The purpose of my testimony is primarily to address:

- 11 1) the expected configuration of the Project,
12 2) an update on the planned base load capacity of the Project,
13 3) an update on the HVDC technology deployment approach for the Project,
14 4) the status of the interconnection work to integrate the Project into the existing bulk
15 electric system and,
16 5) the operational plans for the Project.
17

18 **Q7. IS IT INTENDED FOR YOUR TESTIMONY TO SUPPLEMENT DAVID**
19 **PARQUET'S TESTIMONY?**

20 A. No. Several aspects of the Project have changed since David Parquet's testimony was
21 written and therefore my testimony will supersede that of Mr. Parquet's.
22

1 **II. OVERVIEW OF THE SOUTHERN SPIRIT TRANSMISSION PROJECT**

2 **Q8. PLEASE EXPLAIN THE PROPOSED CONFIGURATION OF THE PROJECT IN**
3 **MISSISSIPPI.**

4 A. The proposed facilities in Mississippi include the ± 500 -600-kVdc transmission line that
5 will contain the HVDC transmission conductors, metallic return conductors, optical ground
6 wires, and associated insulators and hardware. A family of structures representative of the
7 typical tangent and turning angle structure have been developed by SST's engineering
8 consultant Burns & McDonnell, Inc. and are provided as Exhibit DD - 2.

9 In addition to the HVDC transmission line facilities, an HVDC converter station
10 will also be located in Choctaw County, Mississippi (the "Mississippi Converter Station")
11 where energy will be converted from DC back to AC (and vice versa) to be transmitted to
12 demand customers in Mississippi and beyond.

13 Adjacent to the Mississippi Converter Station will be a 500-kVac switching station
14 (the "Mississippi Switching Station") where AC transmission lines can be interconnected
15 to "pick-up" the energy that is transmitted to the Mississippi Converter Station.

16 The Mississippi Switching Station is proposed to interconnect to the electric grid
17 in Mississippi at the nearby Wolf Creek Substation owned by Entergy Mississippi via a
18 short 500-kVac transmission line (less than one mile).

19
20 **Q9. WHY IS THE PROJECT'S EASTERN CONVERTER STATION NOW BEING**
21 **PROPOSED TO BE LOCATED IN CHOCTAW COUNTY, MISSISSIPPI?**

22 A. The Project will need to integrate into the bulk electric system of the Southeastern U.S. in
23 such a way as to optimize the value of the transmission access rights that will become

1 available to utilities in the Southeastern U.S. with an eye on both reliability and resiliency
2 benefits.

3 In 2017, the Project's targeted interconnection strategy was predicated on obtaining
4 access to the electric systems of Southern Company and the Tennessee Valley Authority
5 ("TVA"). Today, it is contemplated that the robust MISO South demand region, as well
6 as the region served by Southern Company in Mississippi, Alabama and Georgia, are better
7 options to reliably integrate the Project facilities and, to do so in a timely manner, resulting
8 in the ability to provide access to around-the-clock renewable energy options for utilities
9 in the Southeast including in Mississippi. The new location of the eastern HVDC converter
10 station in Choctaw County provides access to the MISO South demand region via a new
11 500-kV interconnection to Entergy Mississippi's 500-kV Wolf Creek Substation.

12
13 **Q10. ARE ADDITIONAL TRANSMISSION FACILITIES REQUIRED TO**
14 **INTERCONNECT TO SOUTHERN COMPANY, TVA OR OTHER UTILITY**
15 **SYSTEMS TO THE EAST?**

16 A. Yes. SST may eventually construct new 500-kVac transmission facilities to provide an
17 access point for Southern Company, TVA and/or other utility systems to interconnect
18 beyond the Mississippi Switching Station. When this plan is developed, SST (or another
19 utility, as the case may be) expects to return to this Commission to seek approval, as
20 required, for such additional transmission facilities.

21
22 **Q11. WHAT IS THE PROPOSED BASE LOAD CAPACITY OF THE PROJECT?**

1 A. The Project is expected to be capable of transmitting 3,000 MW of power in either direction
2 (i.e., into Texas and/or into the Southeastern U.S.). In the 2017 filing, the petition focused
3 on a smaller, 2,000 MW capacity of the Project to align with potential restrictions on the
4 Texas end of the Project. Those restrictions, however, were significantly influenced by the
5 type of HVDC technology previously contemplated and the associated voltage constraints
6 in Texas. SST will be studying (with the Electric Reliability Council of Texas (“ERCOT”))
7 both the 2,000 MW and 3,000 MW Project sizes to ensure the Project can achieve at least
8 the 2,000 MW level; however, we are confident that the 3,000 MW level will be able to
9 reliably integrate with the Texas grid.

10
11 **Q12. WHY WAS THE PROJECT DESIGNED TO UTILIZE HVDC TECHNOLOGY TO**
12 **TRANSMIT POWER?**

13 A. There are several reasons why the Project was designed utilizing HVDC technology. First
14 and foremost is the fact that one end of the line will connect into the electric system of
15 ERCOT, which is electrically asynchronous from the other end of the line in the eastern
16 interconnection. Asynchronous transmission grids cannot exchange power with one
17 another over traditional alternating current (“AC”) transmission facilities. HVDC facilities
18 are currently installed between ERCOT and asynchronous grids from ERCOT including
19 the Eastern Interconnection and Mexico. The Project will add to the existing transfer
20 capability between ERCOT and its neighbors by using HVDC technology.

21 Secondly, HVDC technology allows for large power transfers over long distances
22 while adding built-in redundancy to meet NERC TPL standards (e.g., “N-1”) without
23 having to build additional transmission lines. This is because an HVDC “bipole” – which

1 is what the Project is being designed for – is really two independent electrical circuits. That
2 is, each circuit (“pole”) of an HVDC bipole can transfer half of the power of the full bipole
3 even when the other pole is out of service. An AC transmission line transferring 3,000
4 MW has three electrical phases on each transmission tower. If one phase of the AC circuit
5 is unavailable for power transfer, then the entire circuit can no longer transfer power. As
6 such, an AC line in this case would be an N-1 contingency while a DC bipole would be an
7 N-2 contingency. This is important because we operate the grid in the U.S. to be able to
8 withstand the next N-1 contingency (and not necessarily for the more severe and rare N-2
9 contingency). While N-2 contingencies are analyzed in planning studies, they are not
10 typically constraints in the operation of the power grid.

11
12 **Q13. WHY WAS THE PROJECT DESIGNED TO BE BIDIRECTIONAL?**

13 A. HVDC technology is inherently capable of bidirectional power flow. SST is ensuring that
14 the Project is designed to be able to utilize this inherent capability so that the significant
15 grid reliability and resiliency benefits, made possible by integrating HVDC transmission
16 links into the bulk electric system, can be realized. As an example, ERCOT, as an electrical
17 island separated from Mexico and the Eastern Interconnection, will benefit from the
18 Project’s ability to transfer power into ERCOT during supply scarcity events and/or to help
19 facilitate the integration of additional renewable energy by sharing the
20 balancing/integration burden with a larger electrical grid such as the Eastern
21 Interconnection. Similarly, utilities in MISO South and the Southeast will benefit from the
22 ability to receive power from ERCOT during scarcity events. Additionally, HVDC links,
23 due to their ability to connect asynchronous regions, can become a “black start cranking
24 path” to provide another tool for grid operators to restart regions of the electric grid after

1 an event that results in cascading failures. With the various changes to the mix and location
2 of both supply and demand across the U.S., the ever-present reliance on electricity and
3 ongoing electrification of transportation, homes and businesses, as well as increasing risks
4 to grid resiliency, HVDC transmission links will be important assets to the regions that
5 integrate them.

6
7 **Q.14. WHAT NERC RELIABILITY STANDARDS ARE APPLICABLE TO SST?**

8 A. NERC regulates the reliability of the electric grid in the U.S. It performs this role through
9 the creation of mandatory standards associated with the planning and operation of the bulk
10 electric system (“BES”)¹ and enforcement of those standards through its role as the Electric
11 Reliability Organization under Section 215 of the Federal Power Act. SST, as a set of BES
12 facilities, will also need to be planned and operated in accordance with NERC standards.
13 NERC monitors compliance of its standards through its Regional Entities. SST will be
14 under the jurisdiction of the SERC Reliability Corporation Regional Entity.

15 To delineate the roles and responsibilities of various entities that plan and operate
16 portions of the electric system in North America, NERC defines various functional entities
17 in its *Statement of Compliance Registry Criteria*². When a new set of electric transmission
18 and generation facilities are introduced to the electric system, it is important to ensure that
19 the various responsibilities required to reliably integrate and operate those facilities are
20 identified and formally registered with NERC prior to operation and to ensure proper
21 ongoing coordination with other NERC-registered entities.

¹ Visit the NERC BES definition at: <https://www.nerc.com/pa/RAPA/Pages/BES.aspx>

² The NERC Rules of Procedure, including the Statement of Compliance Registry Criteria, can be found online at: <https://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx>

1 In the case of the Project, SST will need to register directly, or through contract-
2 based services by third parties who will register, or are already themselves registered with
3 NERC, to perform the functions of several of the functional entities including: Reliability
4 Coordinator, Transmission Owner, Transmission Service Provider, Transmission
5 Operator, Balancing Authority and Planning Coordinator. Each of these functional entities
6 performs important functions that are tied to requirements within the various NERC
7 reliability standards. As such, the Project will have obligations that need to be met by the
8 owner, operator and contract service providers of the facilities and these parties may be
9 subject to financial penalties should they fail to comply with such obligations. For any
10 NERC-related services that a third party is providing to the Project on behalf of SST, clear
11 delineation of responsibilities including interfaces with other utilities (for example) will be
12 outlined in applicable contracts.

13
14 **Q15. WHAT IS THE STATUS OF THE INTERCONNECTION STUDIES REQUIRED**
15 **FOR THE PROJECT?**

16 A. As the Project has two terminals, this discussion is separated into the western terminus (the
17 “Louisiana Converter Station” located in Louisiana and connecting into Texas) and the
18 eastern terminus (i.e., the Mississippi Converter Station).

19 *Western Terminus* – Initial study work has been performed by ERCOT in May and
20 September, 2019. That study work was predicated on the best available technology at the
21 time of the study. Today, HVDC technology has advanced whereby the studies performed
22 in 2019 will need to be updated to reflect the additional flexibility and capabilities of the
23 latest technology, specifically related to reactive power support. The study work with

1 ERCOT will be re-initiated in 2023. However, the previous study work provides a
2 conservative set of results which are expected to look better after integration of the new
3 technology is studied.

4 *Eastern Terminus* – an HVDC interconnection application and injection rights applications
5 were submitted to MISO in September 2022 and are represented as 500 MW queue
6 positions J2591, J2692 and J2698. The HVDC applications allow MISO to study the
7 integration of the HVDC link without consideration of power exchange with the MISO
8 grid. The injection rights applications allow MISO to then study the exchange of energy
9 from the Project into MISO to identify any constraints and required mitigation of those
10 constraints.

11 SST, as a FERC-jurisdictional entity that will eventually be a registered open access
12 transmission service provider, has also reached out to its eventual neighbor in Mississippi
13 and Alabama (i.e., Southern Company) to begin study work associated with
14 interconnection into the Southern Company service territory. This study work will
15 eventually result in SST submitting a wires-to-wires interconnection request to Southern
16 Company at a location that optimizes the reliability and energy deliverability benefits to
17 the broader grid in the Southeastern U.S. It is expected that the formal interconnection
18 study work with Southern Company will begin in 2023.

19
20 **III. ANTICIPATED OPERATION OF THE SOUTHERN SPIRIT TRANSMISSION**
21 **PROJECT**

22 **Q16. HOW DO YOU EXPECT THAT THE PROJECT WILL OPERATE?**

23 A. The Project will be operated primarily in the west-to-east direction of flow (i.e., from Texas
24 to Mississippi) to bring renewable energy from Texas into the Southeastern U.S. It is

1 expected, however, that power will instead flow from east-to-west when circumstances
2 warrant such as 1) when the Texas energy market prices are significantly higher than prices
3 in the Southeastern U.S. – indicating energy scarcity in Texas and resulting in market
4 signals to incentivize energy imports into Texas – and 2) if Texas experiences emergency
5 conditions that require support from their neighboring utilities.

6
7 **Q17. AT WHAT VOLTAGE DOES SST PLAN TO OPERATE THE PROJECT?**

8 A. The HVDC transmission line facilities will be designed to operate at ± 600 -kVdc, however,
9 it is expected that the HVDC transmission facilities will be operated at a nominal ± 525 -
10 kVdc for the initial several years of operation. This plan allows for the HVDC transmission
11 line to be designed for future expansion without requiring additional right-of-way or new
12 transmission line facilities other than upgrades at each terminal (i.e., the Louisiana
13 Converter Station and the Mississippi Converter Station).

14
15 **Q18. DOES THIS CONCLUDE YOUR TESTIMONY?**

16 A. Yes.

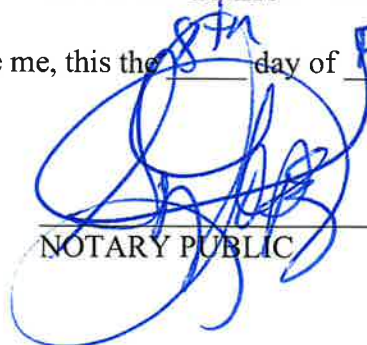

17 67899467.v1

STATE OF Texas
COUNTY OF Harris

Personally appeared before me, the undersigned authority in and for the jurisdiction aforesaid, DERAL DANIS, who after being by me first duly sworn stated that he is the Senior Director of Transmission for Pattern Energy Group LP, and that as such is fully authorized to make this affidavit; and further stated that the matters and things contained in the foregoing Direct Testimony are true, accurate, and correct as therein set forth to the best of his knowledge, information, and belief.

DERAL DANIS
SENIOR DIRECTOR OF
TRANSMISSION,
PATTERN ENERGY GROUP LP

SWORN TO AND SUBSCRIBED before me, this the 8th day of Feb., 2023.

NOTARY PUBLIC

My Commission Expires:
5-12-2023

BEFORE THE
MISSISSIPPI PUBLIC SERVICE COMMISSION

SOUTHERN CROSS
TRANSMISSION LLC

IN RE:

PETITION BY SOUTHERN
CROSS TRANSMISSION LLC
FOR A CERTIFICATE OF
PUBLIC CONVENIENCE AND
NECESSITY FOR THE
PROPOSED SOUTHERN CROSS
TRANSMISSION PROJECT

MPSC DOCKET NO.

DERAL DANIS

ON BEHALF OF

SOUTHERN SPIRIT TRANSMISSION LLC

EXHIBIT DD-1

DERAL DANIS

EXPERIENCE

JUN 2021 – PRESENT

SENIOR DIRECTOR, TRANSMISSION, PATTERN ENERGY

Lead a team of professionals focused on the identification, evaluation, and integration of renewable energy, BESS, and transmission infrastructure projects for Pattern's North American development organization. Support project design and market integration to optimize origination and operations activities.

NOV 2018 – JUN 2021

DIRECTOR, ENGINEERING, CONNECTGEN LLC

Lead a team of professionals with oversight of engineering design, solar module and transformer procurement, interconnection and transmission strategy, transmission system analytics, origination support, and RTO/ISO and utility interfacing.

NOV 2010 – NOV 2018

DIRECTOR, TRANSMISSION, CLEAN LINE ENERGY PARTNERS

Managed interconnection and transmission strategy for Clean Line's multi-billion-dollar portfolio of high-impact transmission projects. Responsibilities included meeting with utilities and ISO/RTO personnel to advance grid impact and interconnection studies, writing and supporting testimony for state siting permits, managing engineering design, origination support, and development of operational plans.

NOV 2007 – NOV 2010

MANAGER, CONSTELLATION ENERGY COMMODITIES GROUP

Supported trading, origination, and portfolio management activities for Constellation's southeastern generation and wholesale load supply deals through powerflow and production simulation analyses as well as transmission service analytics using webOASIS.

NOV 2005 – NOV 2007

OPERATIONS ENGINEER, SOUTHWEST POWER POOL

As a NERC-certified operator, my role involved support of the Reliability Coordination and Market Operator functions of SPP. I learned where the handoff occurs between generation and transmission planning on one hand and operations and the other. Participated in the design and implementation of SPP's first energy market.
